May the phone be with you

Local start-up tenCube has launched WaveSecure, a mobile security service designed to protect both mobile phones and

the data inside them in case of loss or theft. Once installed on the phone, you can remotely lock your phone or wipe out the data contained within from your PC.

You can even set a sound alarm so your phone screams at full volume when it is locked.

But the coolest function of all is the

SIM card tracking. If the thief replaces your SIM card with his, you will be able to track the new number of your phone through your PC.

You can then choose to call the thief or hand the information over to the police.

The software works on mobile phones

running the popular Windows Mobile or Symbian operating systems.

▶ **WaveSecure is currently an invitation-only service. Interested consumers may ask for an invitation code from tenCube to sign up for a free trial at www.wavesecure.com**
